

SQL Injection Union Attack Vulnerability

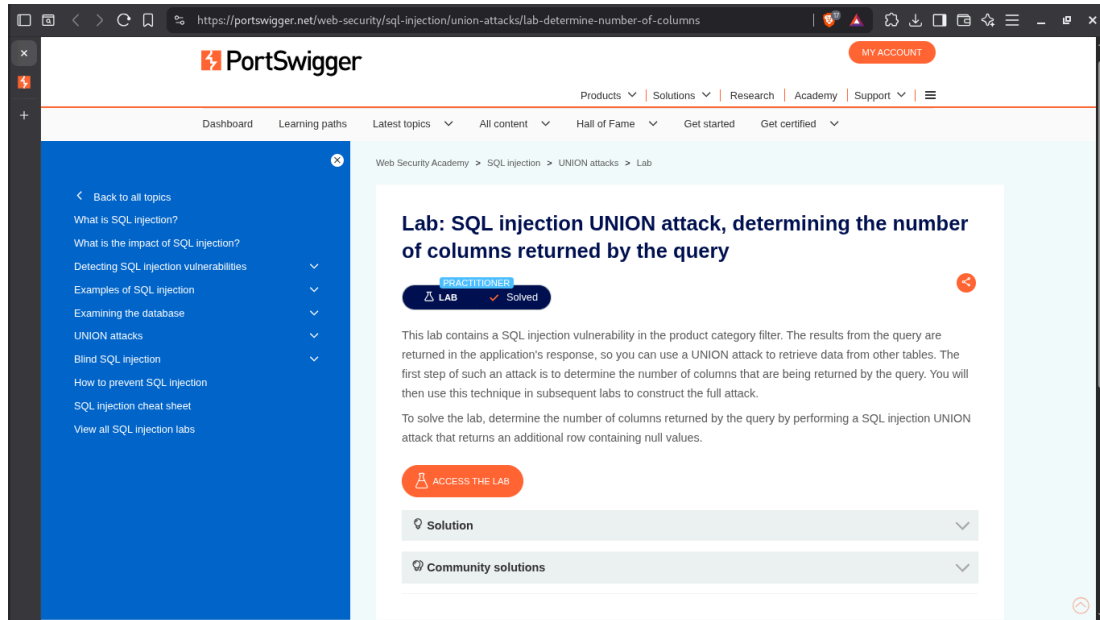

Name: Matyas Abreham

IDNO: CTC-207-26

Lab 3: SQL Injection UNION Attack, Determining the Number of Columns

Objective

Determine the number of columns returned by the original query using a UNION-based SQL injection with NULL values.

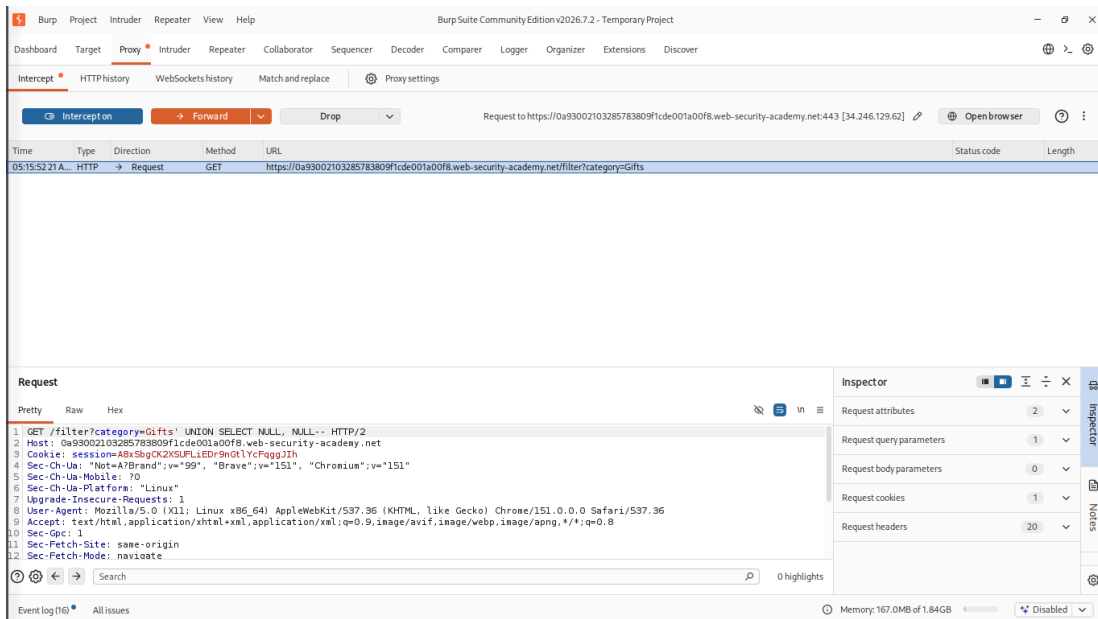

Lab description page (PortSwigger).

Steps

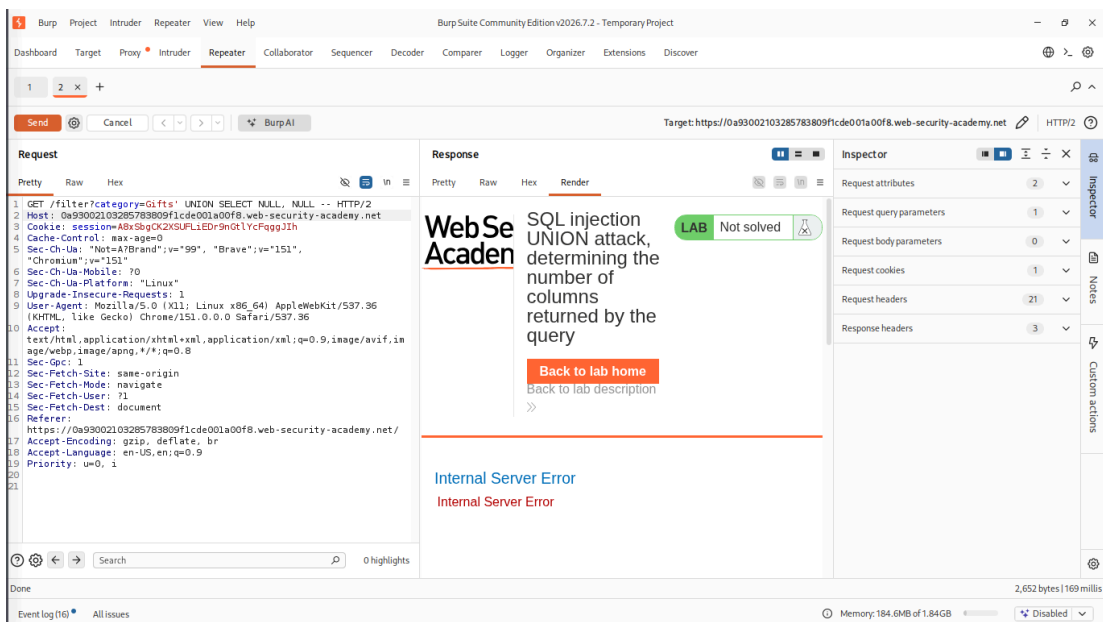

Intercepted the category filter request and tried a UNION SELECT with 2 NULL columns:

```
category=Gifts' UNION SELECT NULL, NULL--
```

Burp Repeater request with a 2-column UNION SELECT.

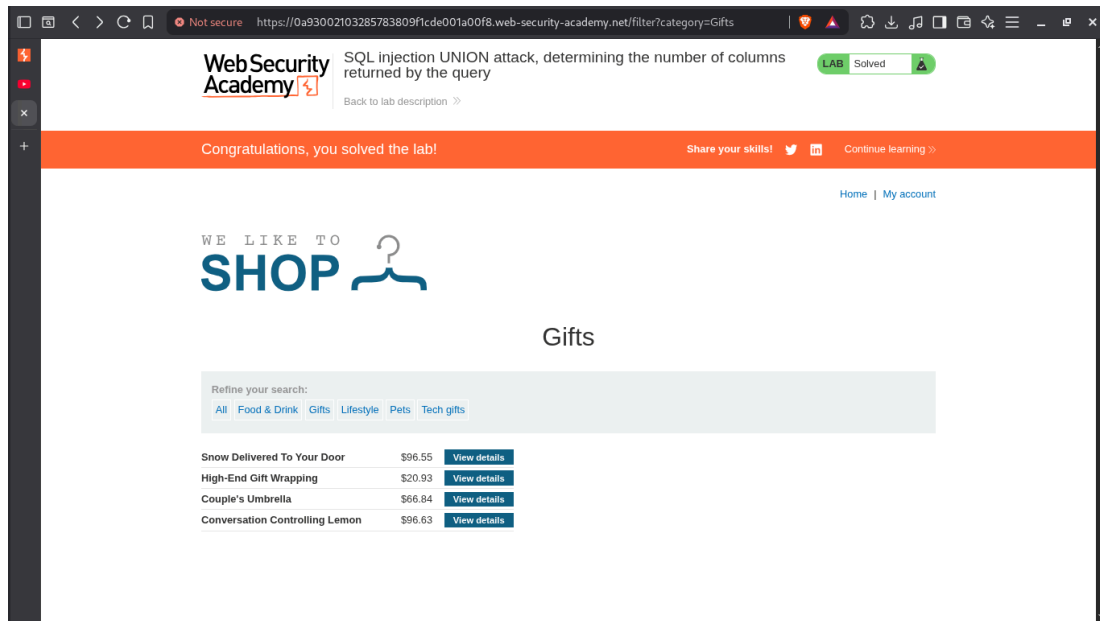

This returned an Internal Server Error, meaning the query does not have 2 columns.

Internal Server Error response for the 2-column attempt.

Increasing the column count to 3 NULLs resolved the error and the page loaded normally, confirming the query returns 3 columns.

Result

Lab marked as Solved with the correct column count.

Vulnerability

The application did not validate or parameterize the category input, allowing UNION-based injection to probe the query structure.
